ABSTRACT:

<CHG DATE=19950115 STATUS=O> Polyurethane mouldings are stabilised by enrichment of the stabiliser at the surface by applying the stabiliser to the surface of the mould before introduction of the foam and/or to the surface of the moulding after demoulding. Preferred stabilisers for this purpose are emulsions containing from about 0.5 to 1.5 parts by weight of the stabiliser, 3-7 parts by weight of a solvent, in particular a fluorinated hydrocarbon, and from 0.5 to 1.5 parts by weight of an emulsifier in 100 parts by weight of water.
